

## Difficult Choices

Read through the true case presented below. Based on your experiences and beliefs, decide whether Mr. Grouch should be artificially fed.

### Case 1: Quality of Life

A 76-year old man (Mr. Grouch) with advanced dementia requiring 24-hour nursing care has now stopped eating and has developed a cough. The quality of his life has markedly diminished in the past few years; he has largely been bedridden and incontinent. While not evidently in physical pain, he is totally confused and often agitated and seems fearful of his surroundings. Should he be artificially fed? (Hébert, 1995, p. 178)

Ethics is about \_\_\_\_\_ and wrong and the \_\_\_\_\_ that we give for our choices and actions. This is clearly central to Health Science, since doing the right thing for patients--minimizing \_\_\_\_\_ and treating illness--contains a large moral component. Ethics should help \_\_\_\_\_ and present alternatives when you are faced with a difficult decision within the Health Science field. When it comes to ethical problems and \_\_\_\_\_, you should first of all be able to recognize them and be able to analyze them carefully; keeping in mind the three core ethical principles:

1. What does the patient want? (\_\_\_\_\_)
2. What can be done for the patient and what are the harms and benefits? (Beneficence and \_\_\_\_\_)
3. Are the patient's requests fair and able to be satisfied? (\_\_\_\_\_)

A 7-step procedure for resolving ethical dilemmas has been proposed by Philip C. Hébert; this is not a moral set of rules, but is "good enough for our purposes" (1995, p. 15).

1. **Recognize that a case raises an important \_\_\_\_\_ problem.** Ethical problems arise when there is a conflict of values and when there are different ways of proceeding. It is important to be as knowledgeable as possible about the case.
2. \_\_\_\_\_ **the problem that needs to be solved.** Once the problem is precisely identified, you will be better able to decide what resources you need to handle the problem.
3. **Determine reasonable \_\_\_\_\_ courses of action.** These options need not be exhaustive, but they should be clearly distinct.
4. \_\_\_\_\_ **each option in relation to the three fundamental ethical principles.** None of these principles is always paramount, but in certain situations, one may trump another.
5. **Decide on a \_\_\_\_\_ to the problem.** Your conclusion may be disputed, so you should be able to say why you think it is the best one.
6. **Consider your position \_\_\_\_\_.**
  - Are there circumstances under which you would advocate a different course of action? Could your decision be formulated into a general principle?
  - Consider your emotions, conscience and the opinion of others.
  - Would you make the same choice if your decision were made public?
7. Do the \_\_\_\_\_ thing!

**Case 2: A Starving Patient with Anorexia: To Feed or Not to Feed?**

A 22-year old woman with an 8-year history of severe anorexia nervosa (an illness of self-starvation), is brought into the emergency room in cardiovascular collapse. She is extremely emaciated, weighing less than 60 pounds, and is virtually unresponsive. She receives a bolus of intravenous glucose and perks up long enough to pull out her intravenous line.

The patient has been admitted numerous times in her starved state and has spent most of her previous eight years in hospital. All corrective therapy has so far failed, and she has been considered one of the most difficult patients by various hospitals. On previous admissions, she has been force fed. Her resistance to this has required restraints and caused major disruptions on the ward. She has not consistently expressed a wish to die, although she told her family doctor that she wished her suffering would end soon and requested no forced feedings in the future. She is unhappy with her weight (she thinks she is overweight) and does not feel that her refusal of food endangers her life.

What should be done on this admission? Suppose the peripheral intravenous line cannot be re-started. Would it be reasonable to provide her nutrition through a gastrostomy tube (a tube in the stomach through a small incision in the abdominal wall) and restrain her against her will until she gains weight? (Hébert, 1995, p. 21)

**\*\*Note:** This patient was in fact not force-fed. After meeting with her family and obtaining consultations with the hospital's ethics committee and the psychiatry department, her physicians deemed her terminally ill, and on the grounds of compassion, did not force-feed her. She died shortly after being admitted.

**Case 4: Prior Wishes**

A 54-year old woman presents to the emergency room in a coma from a drug over-dose. She needs to be intubated and put on a ventilator as her level of consciousness is declining and she will not be able to breathe on her own. She has a written advance directive that says she does not want to be ventilated. Her family says this has been her expressed wish since a motor vehicle accident three years ago left her a quadriplegic. Should she be intubated despite such advance instructions? (Hébert, 1995, p. 33)
